	(150 mg)	(150 mg)	(300 mg)

Note: The Panel on Antiretroviral Therapy and Medical Management of Children Living With HIV (the Panel) supports switching from twicedaily dosing to once-daily dosing of 3TC (using the oral solution or tablets) in children aged  $\geq$ 3 years who have been clinically stable for 36 weeks with undetectable viral loads and stable CD4 T lymphocyte cell counts. Clinicians should choose a once-daily regimen using the once-daily dose of 3TC indicated above (approximately 3TC 10 mg/kg, with a maximum of 3TC 300 mg once daily).

Child and Adolescent (Weighing ≥25 kg) and Adult Dose

- 3TC 150 mg twice daily; or
- 3TC 300 mg once daily

#### [Cimduo] Lamivudine/Tenofovir Disoproxil Fumarate (TDF)

Child and Adolescent (Weighing >35 kg) and Adult Dose

• One tablet once daily

#### [Combivir and Generic] Lamivudine/Zidovudine

Child and Adolescent (Weighing ≥30 kg) and Adult Dose

• One tablet twice daily

#### [Delstrigo] Doravirine/Lamivudine/TDF

Child and Adolescent (Weighing  $\geq$  35 kg) and Adult Dose

 One tablet once daily in antiretroviral (ARV)-naive patients and ARVexperienced patients who have been virologically suppressed (HIV RNA <50 copies/mL) on a stable ARV regimen with no history of treatment failure and no known mutations associated with resistance to the individual components of Delstrigo.

#### [Dovato] Dolutegravir/Lamivudine

Adult Dose

 One tablet once daily with or without food as a complete ARV regimen in antiretroviral therapy (ART)–naive adults with no known mutations associated with resistance to the individual components of Dovato.  Delstrigo and Dovato do not require dose adjustment in mild or moderate hepatic impairment but have not been studied in patients and so are not recommended with severe hepatic impairment.

# Lamivudine Dosing in Patients With Renal Impairment

- Dose adjustment of 3TC is required for patients with renal insufficiency.
- Do not use FDC tablets containing 3TC in patients with creatinine clearance <30 mL/min or patients on dialysis, because the doses of 3TC cannot be adjusted. Data from the FDC DTG/3TC (Dovato) suggest that patients with a sustained creatinine clearance 30–49 mL/min may experience a higher 3TC exposure and should be monitored for hematologic toxicities and potential FDC discontinuation and subsequent adjustment of the treatment regimen. See package inserts for additional information.

• Dovato is not approved by the U.S. Food and Drug Administration (FDA) or recommended by the Panel for use in children or adolescents as a complete ARV regimen. However, it could be used as part of a three-drug regimen in patients who meet the minimum body weight requirements for each component drug.					
[Epzicom] Abacavir/Lamivudine					
Child and Adolescent (Weighing ≥25 kg) and Adult Dose					
One tablet once daily					
[Symfi] Efavirenz 600 mg/Lamivudine/TDF					
Child and Adolescent (Weighing ≥40 kg) and Adult Dose					
One tablet once daily on an empty stomach					
[Symfi Lo] Efavirenz 400 mg/Lamivudine/TDF					
Child and Adolescent (Weighing ≥35 kg) and Adult Dose					
One tablet once daily on an empty stomach					
<ul> <li>Symfi Lo has not been studied in children (sexual maturity ratings [SMRs] 1–3), and major interindividual variability in efavirenz (EFV) plasma concentrations has been found in pediatric patients in a multiethnic setting. The 400-mg dose of EFV may be too low in children or adolescents with SMRs 1 to 3 who weigh ≥40 kg. The use of therapeutic drug monitoring is suggested by some Panel members when Symfi Lo is used in pediatric patients who weigh ≥40 kg (see the Efavirenz section for more information).</li> </ul>					
[Temixys] Lamivudine/TDF					
Child and Adolescent (Weighing $\geq$ 35 kg) and Adult Dose					
One tablet once daily					
[Triumeq PD] Abacavir/Dolutegravir (DTG)/Lamivudine (3TC)					
Child Weighing $\geq$ 10 kg to <25 kg					
<ul> <li>Dispersible Triumeq PD tablets are FDA approved for children weighing ≥10 to &lt;25 kg. Triumeq PD is not recommended for children weighing ≥25 kg who are eligible for adult Triumeq dosing.</li> </ul>					
• Administer the appropriate number of tablets for a child's weight once daily, dispersed in 20 mL of water. See Special Instructions. Triumeq PD tablets should not be swallowed whole, chewed, cut, or crushed.					
Weight-Band Dosing of Triumeq PD Tablets for Children Weighing $\geq$ 10 kg					
WeightRecommended Daily DoseNumber of Triumeq PD Tablets					
10 kg to <14 kg         ABC 240 mg, DTG 20 mg, 3TC 120 mg         4					

14 kg to <20 kg	ABC 300 mg, DTG 25 mg, 3TC 150 mg	5		
20 kg to <25 kg	ABC 360 mg, DTG 30 mg, 3TC 180 mg	6		
≥25 kg	Use Triumeq (see below	)		
• For use in children who are ARV naive or ARV experienced (but integrase strand transfer inhibitor naive) and who are not being treated with uridine diphosphate glucuronosyltransferase 1A1 (UGT1A1) or cytochrome P450 (CYP450) 3A inducers				
[Triumeq] Abacavir/Dolutegravir/Lamivudine				
Child and Adolescent (Weighing $\geq$ 25 kg) and Adult Dose				
One tablet once daily				
• This FDC tablet can be used in patients who are ART naive or ART experienced (but integrase strand transfer inhibitor naive) and who are not being treated with UGT 1A1 or CYP450 3A inducers.				
[Trizivir and Generic] Abacavir/Lamivudine/Zidovudine				
Child and Adolescent (Weighing ≥30 kg) and Adult Dose				
One tablet twice daily				

<sup>a</sup> Epivir HBV oral solution and tablets contain a lower amount of 3TC than Epivir oral solution and tablets. The amount of 3TC in the Epivir HBV solution and tablet was based on dosing for treatment of HBV infection in people without HIV coinfection. Patients with HIV who are taking Epivir HBV as part of their ARV regimen should receive the appropriate amount of oral solution or the appropriate number of tablets to achieve the higher doses of 3TC that are used to treat HIV.

# **Drug Interactions**

Additional information about drug interactions is available in the <u>Adult and Adolescent</u> <u>Antiretroviral Guidelines</u> and the <u>HIV Drug Interaction Checker</u>.

- Drugs that decrease renal function could decrease clearance of lamivudine (3TC).
- **Do not use** 3TC in combination with emtricitabine (FTC), because these drugs have similar resistance profiles and using them together offers no additional benefit.<sup>1</sup> **Do not use** 3TC with fixed-dose combination (FDC) medications that contain 3TC or FTC. Please see <u>Appendix A</u>, <u>Table 1. Antiretrovirals Available in Fixed-Dose Combination Tablets</u> and refer to other sections of the <u>Drug Appendix</u> for drug interaction information about each individual component of FDC tablets.

# **Major Toxicities**

- *More common:* Headache, nausea
- Less common (more severe): Peripheral neuropathy, lipodystrophy/lipoatrophy

• *Rare:* Increased levels of liver enzymes. Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported.

## Resistance

The International Antiviral Society–USA maintains a list of <u>HIV drug resistance mutations</u>, and the <u>Stanford University HIV Drug Resistance Database</u> offers a discussion of each mutation.

# **Pediatric Use**

## Approval

Although 3TC is approved by the U.S. Food and Drug Administration (FDA) for the treatment of children aged  $\geq$ 3 months, both the Panel on Antiretroviral Therapy and Medical Management of Children Living With HIV (the Panel) and the Panel on Treatment of HIV During Pregnancy and Prevention of Perinatal Transmission recommend the use of 3TC from birth.

## Considerations for Use

The efficacy and toxicity of 3TC are equivalent to the efficacy and toxicity of FTC. The oral formulation of FTC has an advantage over the liquid formulation of 3TC because it can be given once daily at antiretroviral (ARV) initiation, whereas the liquid formulation of 3TC needs to be given twice daily at ARV initiation. When pill formulations of 3TC or FTC are used, they can be administered once daily.

## **Comparative Clinical Trials**

Investigators studying the AIDS Therapy Evaluation in the Netherlands (ATHENA) cohort compared the efficacy of tenofovir disoproxil fumarate (TDF) plus FTC to TDF plus 3TC when these drugs were administered with a ritonavir-boosted protease inhibitor (darunavir, atazanavir, or lopinavir) in ART-naive patients.<sup>2</sup> The adjusted hazard ratio for the virologic failure of 3TC-containing regimens compared to FTC-containing regimens within 240 weeks of starting therapy was 1.15 (95% confidence interval, 0.58–2.27). These regimens had no difference in time to virologic suppression during the first 48 weeks of therapy or time to virologic failure after attaining suppression. In a Swiss cohort, Yang et al. found a potential difference in efficacy between FTC and 3TC; however, the difference disappeared after adjusting for pill burden. Current evidence suggests that FTC and 3TC have equivalent efficacy and toxicity in ARV-naive patients.<sup>3</sup>

# Efficacy

3TC has been studied in children with HIV both alone and in combination with other ARV drugs. Extensive data have demonstrated the safety of 3TC and have shown that this drug is associated with clinical improvement and virologic response. It is commonly used in children with HIV as a component of a dual nucleoside reverse transcriptase inhibitor (NRTI) backbone.<sup>4-12</sup> In one study that evaluated the efficacy of NRTI background components, the combination of 3TC plus abacavir (ABC) was superior to zidovudine (ZDV) plus 3TC or ZDV plus ABC in achieving long-term virologic efficacy.<sup>13</sup>

## Pharmacokinetics in Infants

Because of its safety profile and availability in a liquid formulation, 3TC has been given to infants during the first 6 weeks of life starting at a dose of 2 mg/kg every 12 hours before age 4 weeks.<sup>9</sup> A population pharmacokinetic (PK) analysis of infants who received 3TC affirms that adjusting the dose from 3TC 2 mg/kg to 3TC 4 mg/kg every 12 hours at age 4 weeks provides optimal 3TC exposure for infants with normal maturation of renal function.<sup>14</sup> For infants, the World Health Organization weight-band dosing (which is up to five times higher than the FDA-approved dose) results in greater plasma concentrations than the 3TC 2 mg/kg dose.<sup>15</sup> In HIV Prevention Trials Network (HPTN) 040, 3TC was administered as a component of a three-drug regimen to prevent perinatal transmission during the first 2 weeks of life. For 2 weeks, all infants weighing >2,000 g received 3TC 6 mg twice daily, and infants weighing  $\leq$ 2,000 g received 3TC 4 mg twice daily. These doses resulted in 3TC exposure that was similar to the exposure seen in infants who received the standard twice-daily dosing schedule of 3TC 2 mg/kg per dose for neonates.<sup>16</sup>

#### Pharmacokinetics of Liquid Versus Tablet Preparations

The PKs of 3TC have been studied after either single or repeat doses in 210 pediatric subjects. Pediatric subjects who received 3TC oral solution according to the recommended dose regimen achieved plasma concentrations of 3TC that were approximately 25% lower than those of adults with HIV who received the oral solution. Pediatric subjects who received 3TC tablets achieved plasma concentrations that were comparable to or slightly higher than those observed in adults who received tablets. In pediatric subjects, the relative bioavailability of 3TC oral solution is approximately 40% lower than the relative bioavailability of tablets that contain 3TC, despite no difference in the bioavailability of these two formulations among adults. The mechanisms for the diminished relative bioavailability of 3TC oral solution are unknown,<sup>17</sup> but results from a study in adults that compared the PKs of 3TC oral solution administered either alone or with increasing concentrations of sorbitol indicate that sorbitol decreases the total exposure of 3TC oral solution.<sup>18</sup> Sorbitol is a component of several ARV solutions, including ABC, as well as common over-the-counter medications that may be used in infants and young children; this may explain the PK discrepancy between the oral solution and tablet formulations. Modeling of PK data in pediatric patients suggests that increasing the oral solution dose to 3TC 5 mg/kg per dose twice daily or 3TC 10 mg/kg per dose once daily (with a maximum of 3TC 300 mg administered daily) in children aged  $\geq$ 3 months would provide exposures similar to those seen in adult patients who received tablet formulations. However, modeling was done with PK data derived from studies that did not use 3TC liquid formulation, and so modeling may not predict exposures for 3TC oral solution, especially when used with liquid ABC. The Panel **does not recommend** using a once-daily dose of 3TC until a child is aged  $\geq$ 3 years. However, this new dosing schedule is now included in the 3TC package insert, even though no clinical data are available for patients who received both 3TC and sorbitol-containing medications.

## Dosing Considerations—Once-Daily Versus Twice-Daily Administration

The standard adult dose for 3TC is 300 mg once daily, but data are lacking on once-daily administration of 3TC in children. Population PK data indicate that once-daily dosing of 3TC 8 mg/kg leads to area under the curve over 24 hours ( $AUC_{0-24h}$ ) values that are similar to those seen in patients taking 3TC 4 mg/kg twice daily, but minimum blood plasma concentration ( $C_{min}$ ) values are significantly lower and maximum blood plasma concentration ( $C_{max}$ ) values are significantly higher in children aged 1 year to 18 years.<sup>19</sup> Intensive PKs of once-daily versus twice-daily dosing of 3TC were evaluated in children with HIV aged 2 to 13 years in the PENTA (Paediatric European

Network for Treatment of AIDS) 13 trial<sup>4</sup> and in children aged 3 months to 36 months in the PENTA 15 trial.<sup>20</sup> Both the PENTA 13 and PENTA 15 trials used a crossover design with doses of 3TC 8 mg/kg once daily or 3TC 4 mg/kg twice daily. AUC<sub>0-24</sub> and clearance values were similar between these two dosing schedules, and most children maintained an undetectable HIV RNA value after the switch. An ARROW (AntiRetroviral Research fOr Watoto) trial PK study of 41 children aged 3 to 12 years (median age 7.6 years) in Uganda who were stable on twice-daily 3TC also showed equivalent AUC<sub>0-24h</sub> and good clinical outcomes (defined by a low disease stage and a high CD4 T lymphocyte [CD4] cell count) after switching to once-daily 3TC. Median follow-up time during this study was 1.15 years.<sup>21</sup> The larger ARROW trial was a randomized, noninferiority trial that investigated once-daily 3TC and who had been receiving therapy for  $\geq$ 36 weeks. Median follow-up time during the study was 114 weeks. Rates of plasma HIV RNA suppression and adverse event profiles for once-daily 3TC were similar to (and statistically noninferior to) those of twice-daily 3TC.<sup>22</sup>

All four of the studies discussed above enrolled patients who had a low plasma HIV RNA or who were clinically stable on twice-daily 3TC before switching to once-daily dosing. Therefore, the Panel supports switching from twice-daily to once-daily dosing of 3TC in children aged  $\geq$ 3 years who have been clinically stable for 36 weeks with an undetectable viral load and stable CD4 count. Clinicians should use a 10 mg/kg per dose of 3TC oral solution or a weight-based dose of 3TC tablets (neither exceeding 3TC 300 mg) as part of a once-daily regimen.<sup>23</sup> More long-term clinical trials with viral efficacy endpoints are needed to confirm that once-daily dosing of 3TC can be used effectively as part of an initial ARV regimen in children.

3TC undergoes intracellular metabolism to reach its active form, 3TC triphosphate. In adolescents, the mean half-life of intracellular 3TC triphosphate (17.7 hours) is considerably longer than that of unphosphorylated 3TC in plasma (1.5–2 hours). Intracellular concentrations of 3TC triphosphate are equivalent whether 3TC is given once daily or twice daily in adults and adolescents. This supports a recommendation for once-daily 3TC dosing based on FDA recommendations.<sup>24,25</sup>

#### Considerations for Use

Weight-band dosing recommendations for 3TC have been developed for children weighing  $\geq$ 3 kg and receiving either the 10-mg/mL oral solution or the 150-mg scored tablets.<sup>26-28</sup>

Both FTC and 3TC have antiviral activity and efficacy against hepatitis B virus. For a comprehensive review of this topic, see the <u>Hepatitis B Virus</u> section in the <u>Pediatric Opportunistic Infection</u> <u>Guidelines</u>.
